

EV6420-J-00A

Battery Protection IC for 2-/3-Series Cell Li-lon with Protective MOSFET and PTC Interface

DESCRIPTION

The EV6420-J-00A is an evaluation board for the MP6420.

The MP6420 provides overcharge protection that integrates a protective, open-drain MOSFET for 2- or 3-series cell Li-ion power systems.

The MP6420 provides a ±15mV, high-accuracy, overcharge threshold to monitor all series' battery pack conditions. With the high-accuracy threshold, the MP6420 can provide different fixed thresholds from 4.2V to 4.8V internally. Any cell overcharge that occurs turns on the internal protective MOSFET to indicate the error after an internally set, fixed delay time.

The MP6420 is available in a small, space-saving TSOT23-8 package.

ELECTRICAL SPECIFICATION

| Parameter | Symbol | Value | Units |
|------------------------------|----------------|-------|--------|
| Battery cells ⁽¹⁾ | V _B | 2-3 | Serise |

Note:

For Specifications Of Lower Voltage, Please Contact Factory

FEATURES

- Wide VB1 Range from 3.6V to 18V
- Fixed Overcharge Threshold from 4.2V to 4.8V
- High-Accuracy ±15mV Overcharge Threshold
- Supports 2- and 3-Series Cells
- Fixed Delay Time from 2s to 8s
- Integrated 24V/100mΩ Protective MOSFETs
- Low Quiescent Current: 8μA
- OVP Indicator FLAG and PTC Interface
- External Control CTL
- Available in a TSOT23-8 Package

APPLICATIONS

- Battery Pack
- UPS
- Power Tool

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance.

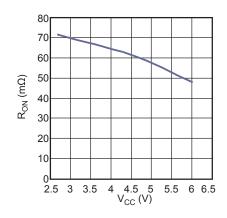

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

EV6420-J-00A EVALUATION BOARD

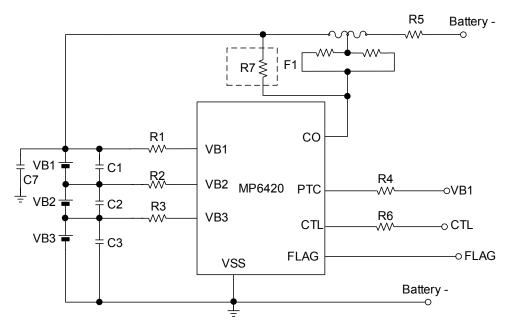

| Board Number | MPS IC Number | | |
|--------------|---------------|--|--|
| EV6420-J-00A | MP6420GG | | |

R_{DS_ON} vs. V_{CC}

EVALUATION BOARD SCHEMATIC

Note: R7 is the pull-up resistor of "CO" pin, just used for evaluation.

EV6420-J-00A BILL OF MATERIALS

| Qty | Ref | Value | Description | Package | Manufacturer | Part Number |
|-----|-------------------------|--------|-----------------------|----------|--------------|--------------------|
| 1 | C1 | 1µF | Ceramic Cap,16V,X5R | 0603 | muRata | GRM188R61C105KA93D |
| 0 | C2, C3 | NC | Film Res,1% | 0603 | | |
| 5 | R1,R2, R3, R5, R6 | 0Ω | Film Res,1% | 0603 | any | |
| 1 | R4 | 10k | | 0603 | any | |
| 0 | F1 | NC | | | | |
| 1 | R7 | 10k | | 0603 | any | |
| 1 | U1 | MP6420 | Battery Protection IC | TSOT23-8 | MPS | MP6420 |

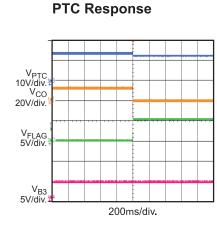

EVB TEST RESULTS

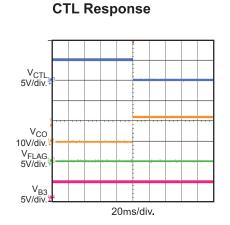

PTC Response

Performance waveforms are tested on the evaluation board.

 V_{B1} to V_{B2} = V_{B2} to V_{B3} = V_{B3} to V_{SS} = 4V with 10k Ω resistor between VB1 and PTC, T_J = 25°C, unless otherwise noted.

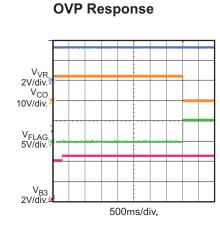

VPTC 10V/div. VCO 20V/div. VFLAG 5V/div. 200ms/div.

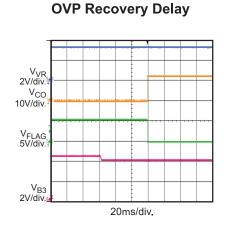

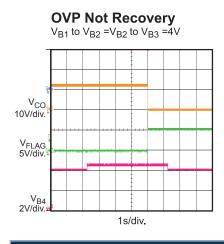

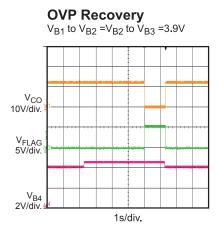

VCTL 5V/div. VCO 10V/div. VFLAG 5V/div. VB3 5V/div.

CTL Response

QUICK START GUIDE

This board is design for 2 or 3 series cell Li-ion battery.

(if power sources are using to similar the Li-ion battery, please make sure the voltage of each channel should be between 3.6V and 6V. Then turn them off).

- Connect the anode of cell-1 to VB3 and cathode to GND or connect positive (+) of power source to VB3, **negative (–)** to GND if you are using power source;
- 2. Connect the anode of cell-2 to VB2 and cathode to VB3 or connect positive (+) of power source to VB2, **negative (–)** to VB3;
- 3. Connect the anode of cell-3 to VB1 and cathode to VB2 or connect positive (+) of power source to VB1, negative (-) to VB2;
- 4. Turn them on if you are using power source (ignore this step if the power supplies are batteries) and the board is working now.
- 5. You can monitor the FLAG and try to increase one cell voltage to higher than 4.45V and wait 4s to see if FLAG turn high (more function please refer the datasheet).
