

EV6532-F-00A

5V to 60V, Three-Phase Brushless DC Motor Pre-Driver Evaluation Board

DESCRIPTION

The EV6532-F-00A is an evaluation board for the MP6532, a three-phase brushless DC motor pre-driver.

The MP6532 operates from a supply voltage of up to 60V. It is configured to drive three half-bridges consisting of six N-channel power MOSFETs. The rotor position information is provided by the Hall sensors assembled in the motor, and the driving control signals are generated by an external controller, such as an MCU, or FPGA.

QUICK START GUIDE

1. Attach the input voltage ($5V \leq V_{IN} \leq 60V$) to the VIN connector, and attach the input ground to the GND connector.
2. To enable the chip, attach a 3.3V or 5V constant voltage to the VH connector, then switch SW1 to position 1 (top side).
3. To set the OCP threshold, attach the over-current protection (OCP) reference voltage ($0.1V \leq V_{OC_REF} \leq 2.4V$) to the OC_REF connector.
4. Attach the Hall signals coming from the motor to the CN1 connector. Attach the Hall sensor power supply to the Hall sensor connector.
5. Attach the driving control signals generated by the external controller to the CN1 connector.
