Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Functional Description

The 93L22 quad 2-input multiplexer provides the ability to select four bits of either data or control from two sources, in one package. The Enable input ($\bar{E}$) is active LOW. When not activated all outputs (Z_n) are LOW regardless of all other inputs.

The 93L22 quad 2-input multiplexer is the logical implementation of a four-pole, two position switch, with the position of the switch being set by the logic levels supplied to the one select input. The logic equations for the outputs are shown below:

$$\begin{aligned} Z_a &= E \cdot (I_{1a} \cdot S + I_{0a} \cdot \bar{S}) & Z_b &= E \cdot (I_{1b} \cdot S + I_{0b} \cdot \bar{S}) \\ Z_c &= E \cdot (I_{1c} \cdot S + I_{0c} \cdot \bar{S}) & Z_d &= E \cdot (I_{1d} \cdot S + I_{0d} \cdot \bar{S}) \end{aligned}$$

A common use of the 93L22 is the moving of data from a group of registers to four common output busses. The particular register from which the data comes is determined by the state of the select input. A less obvious use is as a function generator. The 93L22 can generate four functions of two variables with one variable common. This is useful for implementing random gating functions.
