

AM8T28

Schottky Three-State Quad Bus Driver/Receiver

The Am8T26A/Am8T28 are high speed bus transceivers consisting of four bus drivers with three-state outputs and four bus receivers, also with three-state outputs. Each driver output is internally connected to a receiver input. Both the drivers and receivers have PNP inputs.

One buffered common “bus enable” input is connected to the four drivers and another buffered common “receiver enable” input is connected to the receivers. A LOW on the bus enable (B/E) input forces the four driver outputs to the high-impedance state. A HIGH on the bus enable allows input data to be transferred onto the data bus.

A HIGH on the receiver enable (R/E) input forces the four receiver outputs to the high-impedance state while a LOW on the receiver enable input allows the received data to be transferred to the output. The complementary design of the bus enable and receiver enable inputs allows these control inputs to be connected together externally such that a single transmit/receive function is derived.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer (OCM).

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-35835
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer’s datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. ‘Typical’ values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

FOR REFERENCE ONLY

Am8T26A•Am8T28

Schottky Three-State Quad Bus Driver/Receiver

Distinctive Characteristics

- Advanced Schottky technology
- 48mA driver sink current
- Three-state outputs on driver and receiver
- PNP inputs
- Am8T26A has inverting outputs
- Am8T28 has non-inverting outputs

- Driver propagation delay — 14ns max. for 8T26A; 17ns max. for 8T28
- Receiver propagation delay — 14ns max. for 8T26A; 17ns max. for 8T28
- 100% reliability assurance testing in compliance with MIL-STD-883

FUNCTIONAL DESCRIPTION

The Am8T26A/Am8T28 are high speed bus transceivers consisting of four bus drivers with three-state outputs and four bus receivers, also with three-state outputs. Each driver output is internally connected to a receiver input. Both the drivers and receivers have PNP inputs.

One buffered common "bus enable" input is connected to the four drivers and another buffered common "receiver enable" input is connected to the receivers. A LOW on the bus enable (B/E) input forces the four driver outputs to the high-impedance state. A HIGH on the bus enable allows input data to be transferred onto the data bus.

A HIGH on the receiver enable (R/E) input forces the four receiver outputs to the high-impedance state while a LOW on the receiver enable input allows the received data to be transferred to the output. The complementary design of the bus enable and receiver enable inputs allows these control inputs to be connected together externally such that a single transmit/receive function is derived.

Notes: 1. For conditions shown as MIN. or MAX., use the appropriate value specified under Electrical Characteristics for the applicable device type.

2. Typical limits are at V_{CC} = 5.0V, 25°C ambient and maximum loading.

3. Actual input currents = Unit Load Current x Input Load Factor (See Loading Rules).

4. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.

5. Output sink current is supplied through a resistor to V_{CC}.

6. Measurements apply to each output and the associated data input independently.

DEFINITION OF FUNCTIONAL TERMS

D₀, D₁, D₂, D₃ The four driver inputs.

B₀, B₁, B₂, B₃ The four driver outputs and receiver inputs (data is inverted).

R₀, R₁, R₂, R₃ The four receiver outputs. Data from the bus is inverted while data from the driver inputs is non-inverted.

B/E Bus enable input. When the bus enable input is LOW, the four driver outputs are in the high-impedance state.

R/E Receiver enable input. When the receiver enable input is HIGH, the four receiver outputs are in the high-impedance state.

LOADING RULES (In Unit Loads)

Input/Output	Pin No.'s	LOW Input Unit Load	Fan-out Output HIGH	Output LOW
R/E	1	1/8	—	—
R ₀	2	—	50	10
B ₀	3	1/16	250	25
D ₀	4	1/8	—	—
R ₁	5	—	50	10
B ₁	6	1/16	250	25
D ₁	7	1/8	—	—
GND	8	—	—	—
D ₂	9	1/8	—	—
B ₂	10	1/16	250	25
R ₂	11	—	50	10
D ₃	12	1/8	—	—
B ₃	13	1/16	250	25
R ₃	14	—	50	10
B/E	15	1/8	—	—
V _{CC}	16	—	—	—

A TTL Unit Load is defined as -1.6mA measured at 0.4V LOW and $40\mu\text{A}$ measured at 2.4V HIGH.
